(The factor of in the denominator is present for historical reasons of notation.). The function corresponding to , is the first hypergeometric function to be studied (and, in general, arises the most frequently in physical problems), and so is frequently known as "the" hypergeometric equation or, more explicitly, Gauss's hypergeometric function (Gauss 1812, Barnes 1908).

Integral equations as a generalization of eigenvalue equations. Certain homogeneous linear integral equations can be viewed as the continuum limit of eigenvalue equations. Using index notation, an eigenvalue equation can be written as $\sum_j M_{ij} v_j = \lambda v_i$ where $M = [M_{ij}]$ is a matrix, v is one of its eigenvectors, and λ is the associated eigenvalue. Taking the continuum limit, i.e., replacing the discrete ...
